DETAILED ACTION

Claims 1-20 are pending.

Claim Rejections - 35 USC § 112

- 1. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 2. Claim 20 recites the limitation "the frequency synthesizer" in lines 1-2. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-15 and 17-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hongo et al. (U.S. PATENT NO. 7,089,032) in view of Oono et al. (U.S. PATENT NO. 7,085,587).
 - -Regarding claims 1, 3, 8 and 13, Hongo et al. disclose an RF front-end transceiver (as disclosed in fig. 2) comprising: an oscillator for outputting a resonant frequency signal whose frequency is controlled by a frequency control signal (frequency synthesizer part 140 and 141 as disclosed in fig. 2 and further disclosed in col. 7 lines 6-10); a receive amplifier for amplifying and outputting a receive RF signal (amplifier 122 as disclosed in fig. 2 and further

Art Unit: 2618

disclosed in col. 7 lines 59-63); a receive mixer for mixing the receive RF signal amplified and the resonant frequency signal (mixer 123 as disclosed in fig. 2 and further disclosed in col. 7 lines 59-63); a transmit mixer for mixing a transmit base band signal and the resonant frequency signal to convert the transmit base band signal into a transmit RF signal (mixer 112 as disclosed in fig. 2 and further disclosed in col. 7 lines 3-6); and a transmit amplifier for amplifying and outputting the transmit RF signal (amplifier 130 as disclosed in fig. 2 and further disclosed in col. 7 lines 3-6), wherein a resonant frequency of at least one of the receive amplifier, the receive mixer, the transmit mixer and the transmit amplifier is controlled by the frequency control signal (frequency synthesizer part 140 and 141 generates a number of frequencies by their switching to effectively share frequency channels assigned to a system as disclosed in fig. 2 and further disclosed in col. 7 lines 6-9). However, Hongo et al. fail to disclose the receive mixer converts the receive RF signal into a receive base band signal.

Oono et al. disclose a direct conversion system for directly down-converting a received signal to a baseband signal (I/Q) as disclosed in col. 1 lines 39-53.

Therefore, it would have been obvious to one of ordinary skills in the art at the time of invention to modify the mixer as disclosed by Hongo et al. to be able to direct convert the received signal to a baseband signal as disclosed by Oono et al. One is motivated as such in order to reduce the circuit size.

-Regarding claims 2, 4, 9 and 14, the combination further discloses the frequency control signal is provided from a frequency synthesizer (Hongo et al., frequency synthesizer part 140 and 141 as disclosed in fig. 2 and further disclosed in col. 7 lines 6-10).

-Regarding claims 5, 10, 15 and 17, the combination further discloses the frequency control signal includes an analog frequency control signal and a digital frequency control signal (Hongo et al., as disclosed in fig. 2).

-Regarding claims 6, 11, the combination further discloses the frequency of the resonant frequency signal is controlled by an analog frequency control signal and a digital frequency control signal, and wherein, a resonant frequency of the receive amplifier and the receive mixer is controlled by the frequency control signal (Hongo et al., frequency synthesizer part 140 and 141 as disclosed in fig. 2 and further disclosed in col. 7 lines 6-10).

-Regarding claims 7, 12 and 18, the combination further discloses the receive amplifier has a net input resistance controlled by the digital frequency control signal (Oono et al., the second stage amplifier PGA2 and the third stage PGA3 are respectively configured so as to be capable of adjusting input offsets with resistors attached to their input terminals as disclosed in col. 9 lines 28-47).

-Regarding claim 19, the combination of Hongo et al. and Oono et al. discloses all the limitation as claimed in claim 1. The combination further discloses a base band processor for inputting the receive base band signal and

10/572,725 Art Unit: 2618

for outputting the transmit base band signal (Oono et al., col. 1 lines 39-53), wherein the oscillator, the receive amplifier and the receive mixer comprising an RF front-end receiver exhibiting an input impedance (it is inherent for the oscillator, amplifier and mixer to have an input impedance); the transmit mixer and the transmit amplifier comprising an RF front-end transmitter exhibiting and having an output impedance (it is inherent for the amplifier and mixer to have an output impedance); and the oscillator, the receive amplifier, the receive mixer, the transmit mixer and the transmit amplifier are controlled by the frequency control signal to substantially match an input impedance with an output impedance of the transceiver such that the transceiver transmits substantially a maximum power over a specific frequency band (Impedance should be matched in designing the RF front-end transceiver in order to transmit maximum power as disclosed in applicant's admitted prior, paragraph 6 in the specification).

- 5. Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hongo et al. (U.S. PATENT NO. 7,089,032) in view of Oono et al. (U.S. PATENT NO. 7,085,587) and further in view of Van Rumpt (U.S. PATENT NO. 7,299,018).
 - -Regarding claim 16, the combination of Hongo et al. and Oono et al. discloses all the limitation as claimed in claim 13. However, the combination fails to specifically disclose a LC tank including a capacitor controlled by the digital frequency control signal, a capacitor controlled by the analog frequency control signal and a fixed capacitor.

Van Rumpt discloses a LC tank including a capacitor controlled by the digital frequency control signal, a capacitor controlled by the analog frequency control signal and a fixed capacitor (as disclosed in fig. 1B and further disclosed in col. 5 line 31-col. 6 line 38).

Therefore, it would have been obvious to one of ordinary skills in the art at the time of invention to modify the oscillator as disclosed by Hongo et al. and Oono et al. to be the variable capacitance bank as disclosed by Van Rumpt. One is motivated as such in order to lower the bias voltage and to avoid the need for DC/DC converters.

Response to Arguments

- 6. Applicant's arguments filed 5/7/08 have been fully considered but they are not persuasive.
 - a. In pages 10-13 of the remarks, regarding claims 1, 3, 8 and 13, applicant argues that Hongo and Oono, in whole or in combination do not teach, suggest or disclose the resonant frequency of at least one of the receive amplifier, the receive mixer, the transmit mixer and the transmit amplifier is controlled by the frequency control signal in which the oscillator for outputting a resonant frequency signal whose frequency is also controlled by the same frequency control signal.
 - -The examiner respectfully disagrees. Hongo indeed discloses the oscillator outputs a resonant frequency based on the control signal generated by the frequency synthesizer part 140 and 141 as disclosed in fig. 2 and further

disclosed in col. 7 lines 6-9; and a radio frequency signal received by an antenna 151 is amplified by its corresponding high frequency amplifier (LNA) 122, whose output is mixed with a local oscillation signal by the first mixer 123 as disclosed in col. 7 lines 59-63, therefore, at least the amplifier 122 and the first mixer 123 are indirectly controlled by the frequency control signal generated by the frequency synthesizer part 140 and 141.

- b. In pages 13-15 of the remarks, regarding claim 16, applicant argues that Van Rumpt does not cure the above noted deficiency in replicating the presently claimed invention when combined with Hongo and Oono.
- -The examiner respectfully disagrees. As discussed above, Hongo does teach the limitation and therefore the secondary reference does not need to teach it in order to establish a *prima facie* case of obviousness as set forth under 35 USC § 103.

Conclusion

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to PING Y. HSIEH whose telephone number is (571)270-3011. The examiner can normally be reached on Monday-Thursday (alternate Fridays) 8:00am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Yuwen Pan can be reached on 571-272-7855. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
